

USE CASE

Decision-Ready Identity at Onboarding

Ensuring accurate identity at the point of entry for reliable onboarding decisions

Onboarding is the highest-leverage identity decision an organization makes — and often the one made with the least verified data. Incomplete inputs drive false approvals, unnecessary rejections, and operational drag at the point of entry.

Living Identity® validates identity in real time across multiple trusted sources, turning the moment of onboarding into a moment of confidence — with explainable signals supporting every decision.

The Challenge

At the point of entry, organizations make high-stakes decisions on identity data they cannot fully verify.

Limited, unverified identity inputs
Onboarding data arrives incomplete and unconfirmed

No real-time signal of identity reliability
Teams approve or reject without knowing what the data is worth

False approvals and unnecessary rejections
Decisioning errors that drive fraud loss and customer drop-off

Opaque identity strength at the point of entry
Fragmented data hides the true integrity of every applicant

The Solution

Living Identity® validates identity in real time — turning unverified inputs into decision-ready signals at the moment of entry.

Real-time identity validation
Immediate signals of consistency, existence, and reliability

Cross-source verification
Identity confirmed across multiple trusted, governed sources

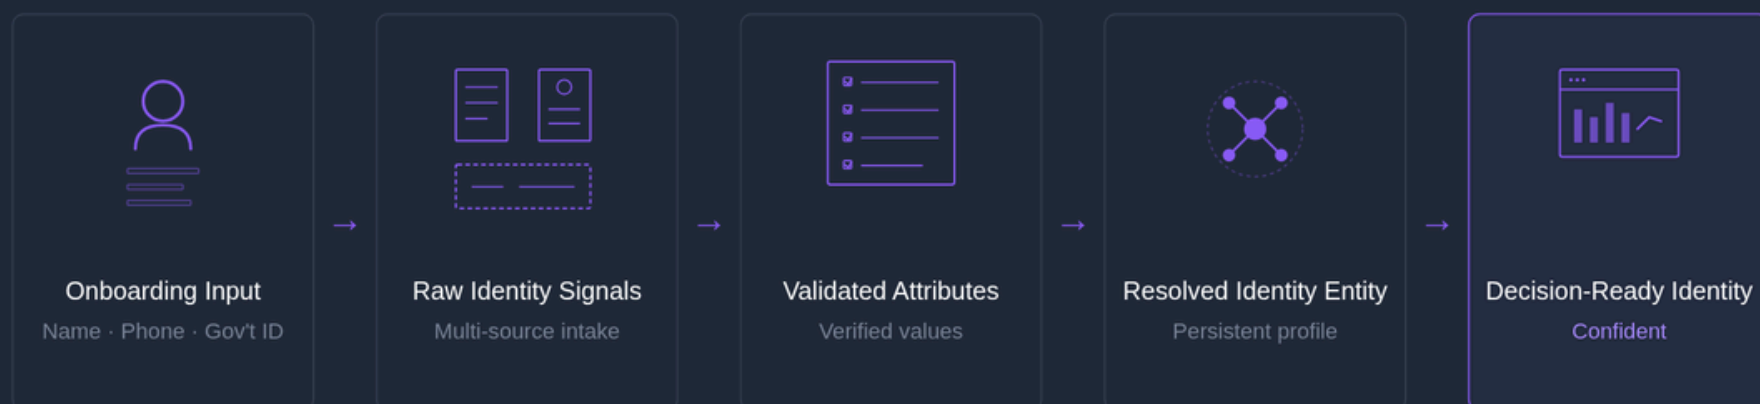

Explainable confidence at decision time
Clear, transparent indicators of identity strength

Verification outcomes you can defend
Every onboarding check supported by traceable, explainable signals

Onboarding Decision Confidence: Identity Signal Validation

Validating identity in real time for confident onboarding decisions

Continuous identity graph reinforcement

Living Identity® is not one-time verification — it is a persistent identity graph

Business Impact

Turning the point of entry into a point of confidence

Higher-confidence onboarding decisions

Validated identity signals at the moment they matter most

Fewer false approvals and rejections

Verified inputs reduce costly downstream errors at the point of entry

Faster time-to-decision

Real-time validation eliminates manual review bottlenecks

Defensible decision trail

Explainable signals support every onboarding outcome under audit
